

Wedge Clamps for Tapered Clamping Edge

double acting, max. clamping force 25 to 630 kN,
with adjustable position monitoring at the back

Advantages

- The clamping range can be flexibly adjusted
- Safe clamping of moulds/dies with tapered clamping edge
- High operational safety by adjustable position monitoring and automatic motion sequence
- Very sturdy design
- High safety standard
- Long service life
- Sizes up to 1250 kN are available on request

Important notes

In case of incorrect operation of the wedge clamps, the clamping bolt may fully retract into the guide housing and thus cause the upper mould/die falling off the ram.

The greasing intervals (high temperature grease) should be adapted to the existing operating conditions. Please note that greasing of the wedge bolt should only be made with the elements being retracted.

The clamping elements must be protected against dirt, scale, swarf, coolant, etc. by means of a suitable covering.

Moulds or dies clamped by means of wedge clamps are subject to side loads that may be strong enough to displace them. Thus, positioning is required to absorb the side loads. Therefore, location pins or suitable limit stops should be provided to keep the moulds and dies in their correct position.

When using wedge clamps on the press ram, it is recommended that multiple-circuit hydraulic supply of the clamping elements and pilot-controlled check valves are used for securing hydraulic clamping.

Circuit diagram

For safety reasons and in the sense of the machine tool guide lines ML2006/42/ EC the hydraulic pressure must be maintained.

When upper moulds/dies are clamped by wedge clamps, they must be secured mechanically when maintenance work is carried out.

Versions

- with position monitoring at the back
max. temperature: 80 °C (type A and B)
max. temperature: 120 °C (type C)

Position monitoring

Inductive proximity switches installed in the flange-mounted housing. The proximity switches are activated by a control cam connected to the piston.

The position monitoring will be screwed on at the cylinder bottom and can also be mounted in a position rotated by 180°.

Different versions are available according to the application conditions.

The integrated position monitoring is coupled to the clamping bolt in a very space-saving way at the back and signals:

1. Clamping bolt in unclamping position
2. Clamping bolt in clamping position
3. Error message when overrunning the clamping position

Clamping force

This is the force the clamping element applies to the mould or die. The mould or die is clamped on the fixture plate by means of this force.

The external forces acting on mould or die (e.g. ejecting force or die cushion force) shall not exceed the totality of the elements' clamping force.

Maximum admissible operating force

This is the force that can be absorbed by the clamping element and the fastener (screws).

It must be ensured that in cases of emergency, e.g. workpiece jammed in mould or die, the sum total of the elements' operating forces is not exceeded.

Application

Double-acting wedge clamp for clamping moulds or dies on a press bed or ram or in injection moulding machines, machines and installations.

Description

The wedge clamp consists of a hydraulic block cylinder and a piston guided in a housing. The clamping bolt is provided with 20° bevel to clamp on the tapered clamping surface of the mould/die.

Based on the internal design of the wedge clamp and the 20° bevel of the clamping bolt, the system is providing internal friction.

Retrofitting to wedge clamping

Wedge clamping of existing moulds/dies is possible by retrofitting V-shaped inserts as shown below. Max. hardness 50 HRc

Wedge clamps with position monitoring at the back, adjustable

The position monitoring can be rotated by 180°. (90° on request)
The block cylinder can be rotated by 180°.

Installation of drill bushings to absorb side loads
The occurring side loads must be absorbed by drill bushings to be inserted into the fixture plate.

The position monitoring is available in 3 variants:

- Type A** – compact version for connector M8
- Type B** – sturdy long version for connector M12
- Type C** – High-temperature version up to 120°C with attached cable (L = 5 m)

Please indicate the desired type in your order, behind the part no., e.g.: **4604670-A**

- A** = Type A
- B** = Type B
- C** = Type C

Position monitoring, adjustable

Description

Inductive proximity switches installed in the flange-mounted housing. The proximity switches are activated by a control cam connected to the piston.

The position monitoring will be screwed on at the cylinder bottom and can also be mounted in a position rotated by 180°.

Different types are available according to the application conditions. A control cam is provided at the extended piston rod causing the activation of the proximity switches. Adjustment of the switching position is effected by displacement of the proximity switches in the lateral groove. The proximity switches are switched on in a stroke range of approx. 6 mm by means of the control cam. The minimum distance to the positions to be monitored depends on the switch type and is indicated in the chart.

Message of proximity switches

S1: Clamping bolt in unclamping position

S2: Clamping bolt in clamping position

S2 is overrun: Clamping bolt in final position (message for no mould/die available or mould/die not clamped)

Design

Careful design is required, corresponding application conditions and safety measures have to be planned and guaranteed.
